

Appendix A: Data Collection & Vehicle Classification

Data Collection

- As the LTN was introduced as a response to COVID-19, no comprehensive dataset existed to represent pre-implementation data. Instead, data was drawn from the following studies commissioned by LB Lambeth since 2017:
 - Healthy Routes:** two rounds of data collection to support development of Healthy Cycling Routes (Nov 2019-Mar 2020)
 - 20mph Study:** data collected to underpin analysis on the 20mph Borough-wide speed limit (Jan 2017)
 - The Floow:** GPS telemetry data, providing detail on vehicle routing through neighbourhood cells; this data will be used alongside Healthy Routes data for roads where no historic data was collected to approximate vehicle flows
- Of the 17 ATC sites, **8** sites uses Healthy Routes as a baseline, **6** sites use the 20mph study and **3** utilise both The Floow data and Healthy Routes.

Data Collection

- Through the monitoring programme, data has been collected across the Borough – this has generally been installed in the same locations as those used in a previous study to ensure a fair comparison, although some additional sites have been added, and these will need to make use of The Floow data instead to enable a comparison.
- All new data for the Railton LTN has been collected via **Automatic Traffic Counters (ATCs)**, which are installations that consist of two pneumatic tubes spanning the width of roads to be surveyed – these capture 15 vehicle classes in both directions based on number of vehicle axles and the distance between axles, and are regularly used across the transport planning profession to capture traffic information.
- Based on the vehicle classifications on the following slide, class 1 & 2 vehicles have been classified as “**car**”, class 3 vehicles have been classed as “**LGV**”, classes 4 to 12 vehicles have been classified as “**HGV**”, class 14 vehicles have been classed as “**motorcycle**” and class 15 vehicles have been classed as “**cycle**.”

Vehicle Classifications

- The table below outlines the **axle-based** vehicle classes as defined by survey companies.

Class	Axes	Groups	Description	Parameters	Dominant Vehicle	Aggregate	
1	SV	2	1 OR 2	Short - Car, light Van	$d(1) \geq 1.7m, d(1) \leq 3.2m \text{ & axles}=2$		Light
2	SVT	3, 4 OR 5	3	Short Towing - Trailer, Caravan, Boat, etc.	$\text{groups}=3, d(1) \geq 2.1m, d(1) \leq 3.2m, d(2) \geq 2.1m \text{ & axles}=3,4,5$		
3	TB2	2	2	Two axle truck or Bus	$d(1) > 3.2m \text{ & axles}=2$		
4	TB3	3	2	Three axle truck or Bus	$\text{axles}=3 \text{ & groups}=2$		Medium
5	T4	>3	2	Four axle truck	$\text{axles}>3 \text{ & groups}=2$		
6	ART3	3	3	Three axle articulated vehicle or Rigid vehicle and trailer	$d(1)>3.2m, \text{axles}=3 \text{ & groups}=3$		
7	ART4	4	>2	Four axle articulated vehicle or Rigid vehicle and trailer	$d(2)<2.1m \text{ or } d(1)<2.1m \text{ or } d(1)>3.2m \text{ axles}=4 \text{ & groups}>2$		Heavy
8	ART5	5	>2	Five axle articulated vehicle or Rigid vehicle and trailer	$d(2)<2.1m \text{ or } d(1)<2.1m \text{ or } d(1)>3.2m \text{ axles}=5 \text{ & groups}>2$		
9	ART6	>=6	>2	Six (or more) axle articulated vehicle or Rigid vehicle and trailer	$\text{axles}=6 \text{ & groups}>2 \text{ or } \text{axles}>6 \text{ & groups}=3$		
10	BD	>6	4	B-Double or Heavy truck and trailer	$\text{groups}=4 \text{ & axles}>6$		
11	DRT	>6	5	Double road train or Heavy truck and two trailers	$\text{groups}=5,6 \text{ & axles}>6$		
12	TRT	>6	>6	Triple road train or Heavy truck and three (or more) trailers	$\text{groups}>6 \text{ & axles}>6$		
14	M/C	2	1 OR 2	Motorcycle	$d(1) \geq 1.18m, d(1) \leq 1.7m \text{ & axles}=2$		Light
15	CYCLE	2	1 OR 2	Cycle	$d(1) < 1.18 \text{ & axles}=2$		

Vehicle Classifications

- The Automatic Traffic Counters (ATCs) used in this study are considered a reliable, tested method of data collection, and are utilised throughout the transport industry to understand traffic volumes on roads.
- Whilst such counters are generally considered at least 95% accurate in collecting correct traffic data, there is some room for error in vehicle classification (for example tandem cycles being classed as motorbikes given the distance between axles, or scooters being classed as cycles). However, **most** issues occur in the sorting of different types of HGVs into the 9 relevant categories.
- More commonly, vehicles park on or across ATCs, leading to periods where no data is collected. This occurs in pre- and post-implementation data in equal measure, and where such occurrences are likely to have a material impact on analysis results, such missing data has been “patched” or “infilled” using appropriate replacements (*for example, patching blank data 10-11am on a Wednesday with data from 10-11am the day before*). This is a standard practice in the transport industry.

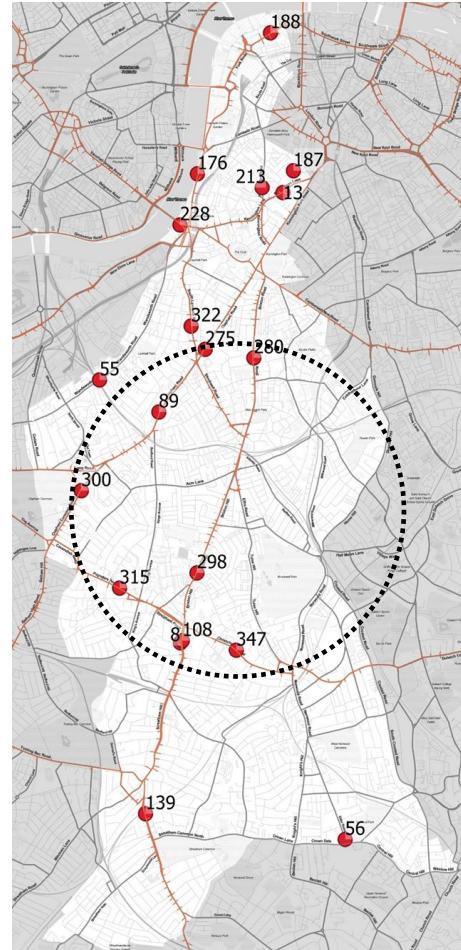

Appendix B: Data Normalisation

Data Normalisation (1)

- A “**baselining**” or “**normalisation**” process has been undertaken to approximate a “no-LTN” case for all sites, providing a point of comparison against which recorded “with-LTN” data can be compared.
- Under normal circumstances, this baseline case would have taken flows from before the scheme implementation and compared these (sometimes with a slight adjustment to compensate for population change/employment levels/etc.) to post-implementation flows.
- The nominal (# of vehicles) and percentage changes would *help* indicate, amongst other factors, whether the scheme had achieved its stated goals.
- Given that the LTNs have been part of Lambeth’s emergency response to the COVID-19 pandemic, and that background traffic flows have been very abnormal since March 2020, the aforementioned process could not be followed in such a straightforward manner.

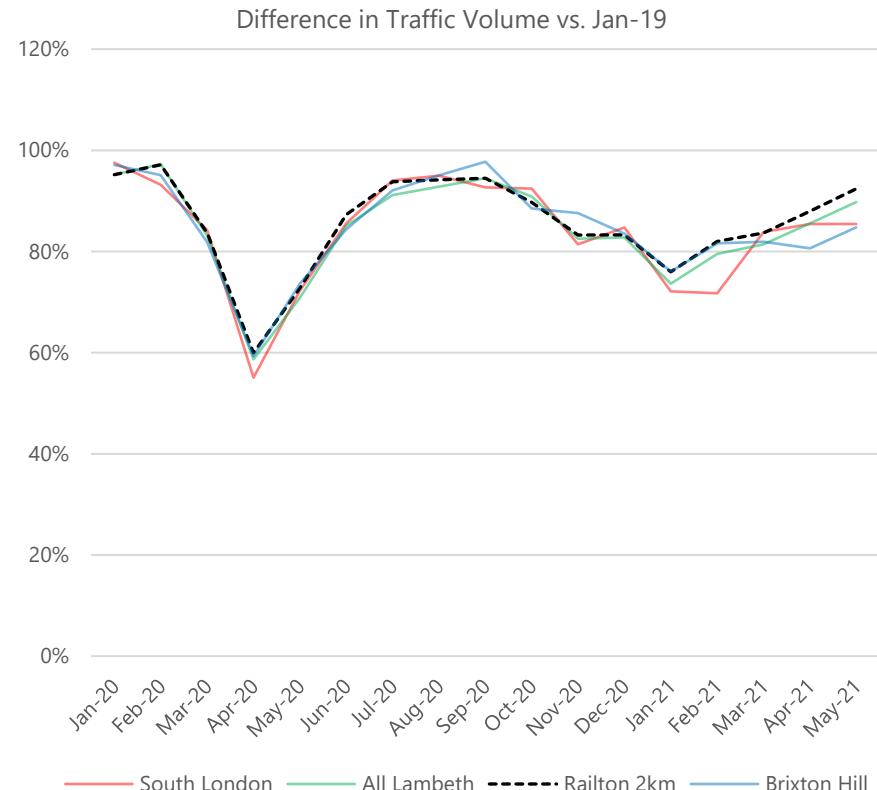

Data Normalisation (2)

- Instead, to ensure as fair a comparison as possible, flow data from before the LTN was installed (“pre-implementation” data) has been **normalised to May 2021**, when the most recent traffic counts were conducted, representing what would have happened *with* the COVID-19 pandemic, but *without* the LTN.
- The normalisation process uses a “scaling factor” based on the volume of traffic at TfL continuous traffic counters in Lambeth, and within 2km of the LTN’s centre (shown right), for locations where consistent data is available.
- It should be noted that the normalisation is a **general** adjustment in terms of **magnitude and direction** of change, rather than an **exact** adjustment.

Data Normalisation (3)

- The chart to the right shows profiles of traffic flows under various calculation methodologies: ATC counters in all of Lambeth, within 2km of the Railton LTN and at an ATC adjacent to the LTN on Brixton Hill
- As a balance between representing local flows and ensuring erroneous traffic events (collisions/construction) do not unduly impact normalisation, the **Railton +2km approach has been utilised in this report.**

Data Normalisation (4)

- The “scaling factor” used for this normalisation **differs by site**, as pre-implementation data was drawn from a variety of different studies occurring between 2017 and early 2020 and factors have therefore been calculated specifically based on the pre- and post-implementation study periods.
- Because traffic has typically been lower than pre-COVID throughout 2020-2021, normalising data represents a conservative approach to analysis, and would tend to underestimate reductions in vehicle numbers.
- The below example shows how the scaling factor is calculated and applied to flows for Railton Road (Central):

$$\frac{\text{TfL ATC traffic flow: May 24-30, 2021}}{\text{TfL ATC traffic flow: November 20-26, 2019}} = \frac{1,436,058}{1,496,357} = 96.0\% \quad \longrightarrow \quad \text{May '21 flows are 96.0% of November '19 flows}$$

$$\frac{\text{Railton Road flows: May 2021}}{(\text{Railton Road flows: November 2019}) * (\text{Scaling Factor})} - 1 = \frac{516}{5,423 * 96.0\%} - 1 = \frac{516}{5,204} - 1 = 0.15 - 1 = -85\%$$

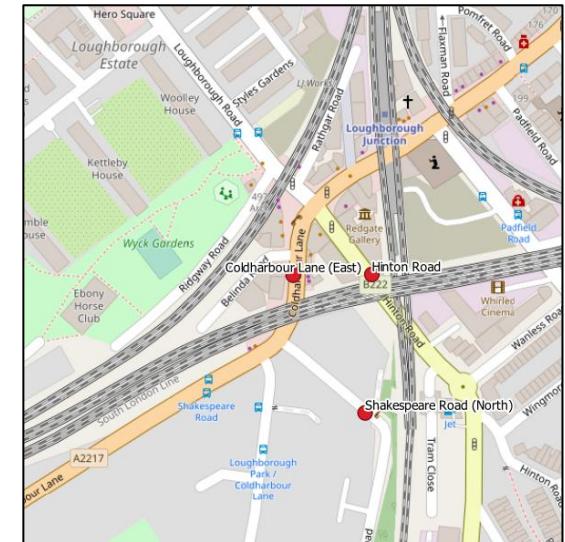

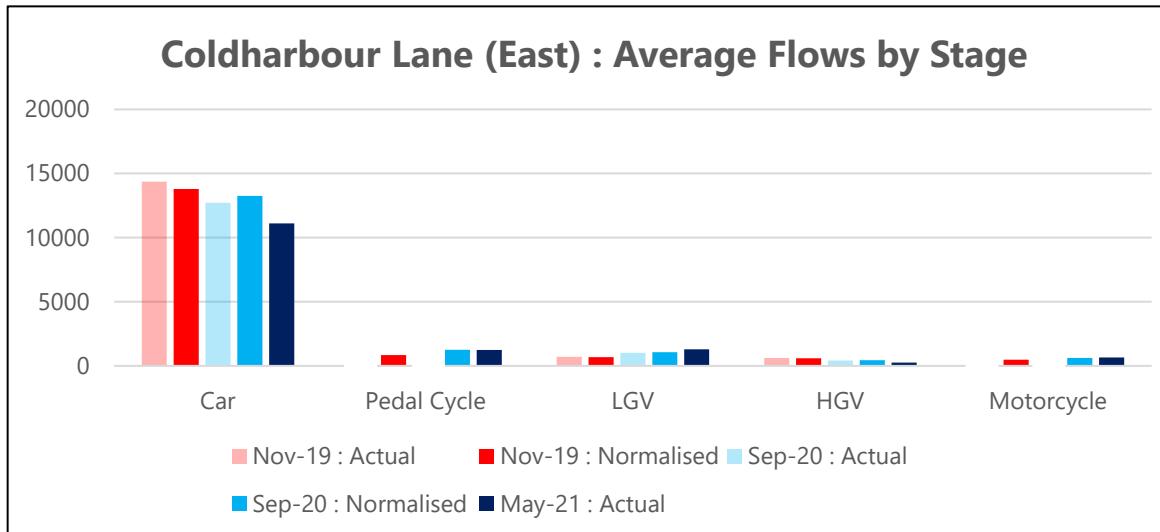

↓
85% decrease in car flows

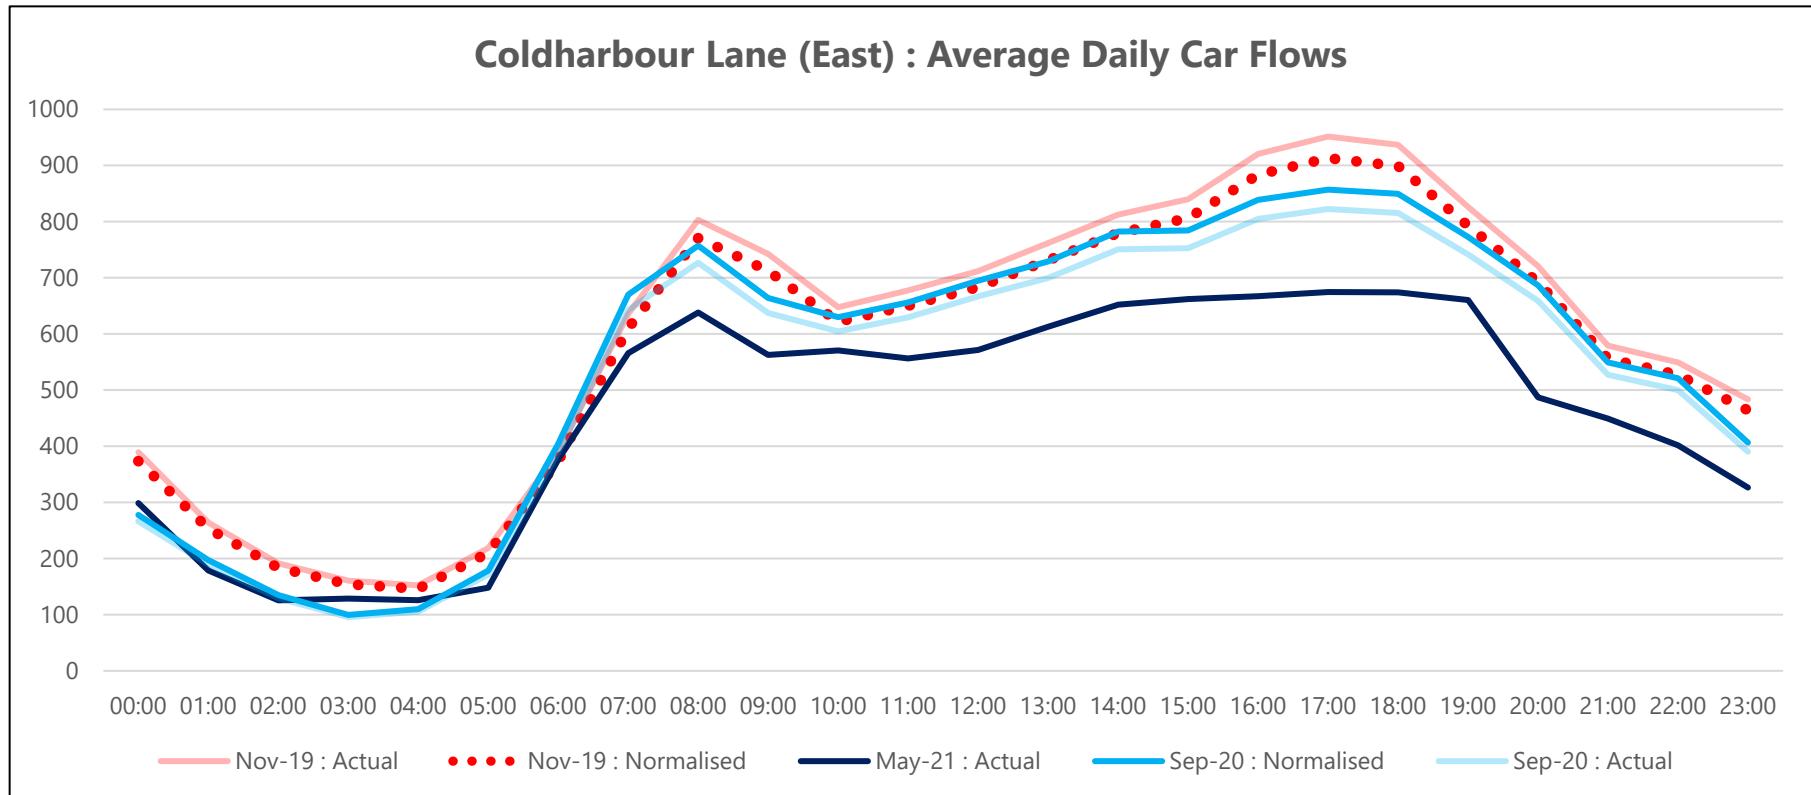

Appendix C: Traffic Flow Results

Coldharbour Lane East (Daily Flows)

- The charts below and on the following pages show the normalised **average daily flows on Coldharbour Lane East**, showing the difference between pre-implementation flows collected in November 2019 and post-implementation flows from September 2020 and May 2021.
- Some data from the Wed-Fri of the May 2021 dataset was of poor quality; this was patched as a proportional adjustment based on data from September 2020.
